Safety Considerations at Uncontrolled Pedestrian Crossings

November 20, 2014

Presented by:
Bryan T. Nemeth, P.E., PTOE
Bolton & Menk, Inc.

Made possible by the Local Road Research Board

This presentation does not make any legal standings and is based on the understanding of the law by a Professional Engineer. No guarantees of the law are provided.
Background

• Pedestrian Crossings are an important feature of the multi-modal transportation system.

• Difficulty:
  – Where should pedestrian crossings be considered?
  – When to consider no changes?
  – When to consider marking pedestrian crossings?
  – When to consider other treatment options?
State Statute Important Points

- All intersections include legal pedestrian crossings whether marked or unmarked
- All marked crossings are legal pedestrian crossings, intersection or mid-block
- Drivers shall stop to pedestrians in legal crossings
  - Pedestrians shall yield the right-of-way to vehicles at all other locations
- A bicycle is considered a pedestrian when using a crosswalk
But....motorists may not always stop for pedestrians
Safety Considerations

- Safety Effects of Marked Versus Unmarked Crossings at Uncontrolled Locations

- “Pedestrians have a right to cross the road safely and without unreasonable delay.”
Safety Evaluation

Figure 18. Pedestrian crash rate versus type of crossing.
Marked vs Unmarked Crosswalks

- Why are there more crashes that occur at marked crosswalks at high traffic volumes?
  - False sense of security?
  - More pedestrians?
  - More vulnerable populations use them?
- Higher volume typically leads to more lanes of traffic
  - Multiple-Threat?
Multiple Threat Video
## FHWA Recommendations

Table 11. Recommendations for installing marked crosswalks and other needed pedestrian improvements at uncontrolled locations.*

<table>
<thead>
<tr>
<th>Roadway Type (Number of Travel Lanes and Median Type)</th>
<th>Speed Limit**</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>$\leq$ 48.3 km/h (30 mi/h)</td>
</tr>
<tr>

<td>C</td>
</tr>
<tr>
<td>Three lanes</td>
<td>C</td>
</tr>
<tr>
<td>Multiline (four or more lanes) with raised median***</td>
<td>C</td>
</tr>
<tr>
<td>Multiline (four or more lanes) without raised median</td>
<td>C</td>
</tr>
</tbody>
</table>

* These guidelines include intersection and midpoint locations with no traffic signals or stop signs on the approach to the crossing. They do not apply to school crossings. A two-way center turn lane is not considered a median. Crosswalks should not be installed at locations that could present an increased safety risk to pedestrians, such as where there is poor sight distance, complex or conflicting designs, a substantial volume of heavy trucks, or other dangers, without first providing adequate design features and/or traffic control devices. Adding crosswalks alone will not make crossings safe, nor will they necessarily result in more vehicles stopping for pedestrians. Whether or not marked crosswalks are installed, it is important to consider other pedestrian facility enhancements (e.g., raised median, traffic signal, road narrows, enhanced pedestrian crossing, pedestrian crossing, pedestrian crossing, pedestrian crossing, pedestrian crossing, pedestrian crossing, pedestrian crossing). As needed, to improve the safety of the crossing. These are general recommendations; good engineering judgment should be used in individual cases for deciding where to install crosswalks.

** Where the speed limit exceeds 64.4 km/h (40 mi/h), marked crosswalks alone should not be used at unsignalized locations.

*** The median or crossing island must be at least 1.2 m (4 ft) wide and 1.8 m (6 ft) long to serve adequately as a refuge area for pedestrians. In accordance with MUTCD and American Association of State Highway and Transportation Officials (AASHTO) guidelines.

C = Candidate sites for marked crosswalks. Marked crosswalks must be installed carefully and selectively. Before installing new marked crosswalks, an engineering study is needed to determine whether the location is suitable for a marked crosswalk. For an engineering study, a site review may be sufficient at some locations, while a more in-depth study of pedestrian volume, vehicle speed, sight distance, vehicle mix, and other factors may be needed at other sites. It is recommended that a minimum utilization of 20 pedestrian crossings per peak hour (or 15 or more elderly and/or child pedestrians) be confirmed at a location before placing a high priority on the installation of a marked crosswalk alone.

P = Possible increase in pedestrian crossing risk may occur if crosswalks are added without other pedestrian facility enhancements. These locations should be closely monitored and enhanced with other pedestrian crossing improvements, if necessary, before adding a marked crosswalk.

N = Marked crosswalks alone are insufficient, since pedestrian crossing risk may be increased by providing marked crosswalks alone. Consider using other treatments, such as traffic-calming treatments, traffic signals with pedestrian signals where warranted, or other substantial crossing improvement to improve crossing safety for pedestrians.

In some situations (e.g., low-speed, two-lane streets in downtown areas), installing a marked crosswalk may help consolidate multiple crossing points. Engineering judgment should be used to install crosswalks at preferred crossing locations (e.g., at a crossing location at a streetlight as opposed to an unlit crossing point nearby). While areas of marked crosswalks at uncontrolled locations should be avoided, higher priority should be placed on providing crosswalk markings where pedestrian volume exceeds about 25 per peak hour (for or more elderly pedestrians and/or children per peak hour).

Marked crosswalks and other pedestrian facilities (or lack of facilities) should be routinely monitored to determine what improvements are needed.
Safety Effects of Marked Versus Unmarked Crossings at Uncontrolled Locations

“At uncontrolled pedestrian crossing locations, installing marked crosswalks should not be regarded as a magic cure for pedestrian safety problems. However, marked crosswalks also should not be considered as a negative measure that will necessarily increase pedestrian crashes. Marked crosswalks are appropriate at some locations (e.g., at selected low-speed, two-lane streets at downtown crossing locations) to help channel pedestrians to preferred crossing locations, but other roadway improvements are also necessary (e.g., raised medians, traffic-calming treatments, traffic and pedestrian signals when warranted, or other substantial crossing improvement) when used at other locations.”
Minnesota MUTCD

• “New marked crosswalks alone, without other measures designed to reduce traffic speeds, shorten crossing distances, enhance driver awareness of the crossing, and/or provide active warning of pedestrian presence, should not be installed across uncontrolled roadways where the speed limit exceeds 40 mph and either:

A. The roadway has four or more lanes of travel without a raised median or pedestrian refuge island and an ADT of 12,000 vehicles per day or greater; or

B. The roadway has four or more lanes of travel with a raised median or pedestrian refuge island and an ADT of 15,000 vehicles per day or greater.”
Relationship between Speed and Risk of Fatal Injury

Figure 4.1: Risk of pedestrian fatality calculated using logistic regression from the Ashton and Mackay, OTS and police fatal file, and Rosen and Sander datasets.
Could safety be the only consideration?

• What about a heavily used pedestrian crossing?
• What about a crossing that directly connects an origin and destination?
• What if the alternative crossing location is one block away, ¼ mile away, ½ mile away?
Walk decisions are primarily based upon three factors:

- travel distance,
- personal safety and security,
- and personal comfort and attractiveness.
Alternative Routes

• Check to see if an alternate route can serve the same movements effectively while providing less delay
  – This includes the entire travel time to traverse the route
  – Example:
    • Traffic signals at ¼ mile spacing
    • Pedestrian at mid-point between signalized intersections
    • Estimate 30 seconds of delay at signal

\[
\frac{660 \text{ ft}}{3.5 \text{ ft/s}} + 30 \text{ sec} + \frac{660 \text{ ft}}{3.5 \text{ ft/s}} = 407 \text{ seconds (6.8 minutes) of delay (LOS F)}
\]

• This is unacceptable to pedestrians
• Mid-point crossing, even with the wait, could be faster
Guide for the Planning, Design, and Operation of Pedestrian Facilities

• If grade-separated crossings are an alternative at a crossing location, the use of the grade separated crossing depends on the time to use each alternative route.
  – If the crossing time of the underpass or overpass crossing is generally more than the crossing time at ground level, there is a high probability that pedestrians will not use the underpass or overpass route.

</table>
Bring different evaluation methodologies together

- What to do when delay is unacceptable?
  - Add a treatment to provide acceptable service?
  - Ignore, just consider safety?
- Should we account for both?
- How do we account for both?
- Are there other factors that should be considered?
  - Pedestrian volume
  - Origins and destinations
- How do we consider all of the factors?
“Crosswalk lines should not be used indiscriminately. An engineering study should be performed before a marked crosswalk is installed at a location away from a traffic control signal or an approach controlled by a STOP or YIELD sign. The engineering study should consider the number of lanes, the presence of a median, the distance from adjacent signalized intersections, the pedestrian volumes and delays, the average daily traffic (ADT), the posted or statutory speed limit or 85th-percentile speed, the geometry of the location, the possible consolidation of multiple crossing points, the availability of street lighting, and other appropriate factors.”

* The application of a crosswalk and any treatments shall consider engineering judgment and shall be approved by the jurisdictional authority.
Field Data Review

Uncontrolled Pedestrian Crossing Data Collection Worksheet

The first step in understanding the pedestrian needs at a potential crossing location is completing a review of the location and adjacent facilities.

### General
- **Crossing Length:** Measure the crossing distance from curb to curb. Crossing 1: ft. Crossing 2: ft.
- **Width of crossing:** ft.
- **Width of median at crossing location:** ft.
- **Crossing Width:** Effective crosswalk width
  - Rebuilt Median Available? [ ] Yes [ ] No
  - ADA Compliant Median Available [minimum 4’ x 4’ landing]? [ ] Yes [ ] No

### Roadway Curvature and Sight Distances
- **Average walking speed:** mph
- **Equations to calculate the following:**
  - Direction 1: Stopping Sight Distance (SSD) ft. provided? [ ] Yes [ ] No
  - Direction 2: Stopping Sight Distance (SSD) ft. provided? [ ] Yes [ ] No
  - Direction 1: Pedestrian Sight Distance (PSD) ft. provided? [ ] Yes [ ] No
  - Direction 2: Pedestrian Sight Distance (PSD) ft. provided? [ ] Yes [ ] No

### Traffic and Pedestrian Data
- **Peak AM Hourly:** Ps 15-min
- **Peak PM Hourly:** Ps 15-min

### Lighting
- **Is street lighting present and does it light the crosswalk location?** [ ] Yes [ ] No
- **Crosswalk Pavement Markings:** Is the pedestrian crossing currently marked? [ ] Yes [ ] No
- **What is the condition of the markings?** [ ] Excellent [ ] Good [ ] Fair [ ] Poor
- **Are the markings easily defined?** [ ] Yes [ ] No
- **Do they need replacement?** [ ] Yes [ ] No

### Signage
- **Current location at crosswalk?** [ ] Yes [ ] No
- **Currently in advance of crosswalk?** [ ] Yes [ ] No

### Enhancements
- **Distance to nearest marked crosswalk:** ft.
- **What pedestrian control devices are present at the nearest adjacent marked crosswalk?**
- **Distance to nearest all-way stop, roundabout or signalized intersection:** ft.

### Additional Site Characteristics
- **Could another location serve the same pedestrian crossing movement?** [ ] Yes [ ] No
- **Could another location serve the same pedestrian crossing movement more effectively?** [ ] Yes [ ] No

---

Uncontrolled Pedestrian Crossing Data Collection Worksheet

Mark the following: the distances and potential conflicts, pavement markings, crosswalk, edge lines, center lines, lane lines, stop lines, and any other markings, signing, location of lighting units, curb ramps, transverse domes, presence of any other crosswalks or crossing locations parallel to or nearby the location being studied, adjacent intersection traffic control, parking, intersection widths, lane lengths, shoulder widths, sign placement, and nearby signs and destinations.

Mark the following:
- x-notch
- x-notch
- x-notch

**Sight Distance Calculations:**

\[
S = \frac{1}{2} \left[ \frac{a + \sqrt{a^2 + 4b}}{2} \right] + \frac{L}{2}
\]

where:
- \( S \) = sight distance, ft.
- \( a = \) deceleration rate, ft/s²
- \( b = \) average pedestrian walking speed, ft/s
- \( L = \) length of crossing, ft.
**2010 Highway Capacity Manual (HCM)**

**Pedestrian Level of Service (LOS) at Uncontrolled Crossing Locations**

**Intersection and Mid-Block Crossings**

**Introduction:**

The Worksheets provide a procedure for evaluating the Level of Service (LOS) at uncontrolled pedestrian crossings according to the methodology presented in Chapter 19 of the 2010 Highway Capacity Manual. Uncontrolled pedestrian crossings include: marked crossings at mid-block locations; marked crossings at intersections; and unmarked crossings at intersections, that are not controlled by a traffic control device such as signals and stop or yield signs.

Use of these Worksheets in Microsoft Excel results in an automated procedure. While this automated procedure has been checked for accuracy using multiple examples, no warranty is made by the developers as to the accuracy, completeness, or reliability of the equations and results. No responsibility is assumed for incorrect results or damages resulting from the use of these worksheets.

This process is not for use at signalized crossings and has not been verified to be accurate for unsignalized pedestrian crossings within a signalized corridor.

The equations and methodology presented through this process is contained within the 2010 Highway Capacity Manual (HCM). Any questions on the approach, assumptions, and limitations of the procedure or for verification of equations are directed to the 2010 HCM.

This material was developed by Bolton & Menk, Inc. in coordination with the Local Road Research Board (LRRB) for the use by practitioners. These Worksheets are made without charge and under no circumstances shall be sold by third parties for profit.

Submitted for Approval: May 22, 2014

Consider Appropriate Treatment Options

- Appropriate treatment options should be considered for crossing locations based on a consistent approach.
  - Flowchart may be used to provide this approach

- In many cases, the most appropriate option is to keep the location unmarked and unsigned (i.e. “Do Nothing”), as any treatment may increase the crash potential at the location.

- Treatment options:
  - Signing and Marking Treatments
  - Uncontrolled Crossing Treatments
  - Traffic Calming Treatments
  - High Level Treatments
Traffic Engineering Manual

• The non-uniform application, misuse, or overuse of crosswalk safety treatments may result in:
  – Noncompliance with traffic control devices
  – Decrease in safety and/or
  – Disregard of traffic control device
Critical Placement and Design Elements

- Sight Distance
- Clear Sight Lines
- Link Origins and Destinations
- Curb Ramps
- Truncated Domes
- Medians/Islands
- Lighting
Treatments Consideration

• Enhanced Treatments
  – Pedestrian Volume
  – Roadway Speed
  – Vehicle Volume
  – Level of Service for different times of day
  – School Crossing
Treatment Options
